Industry Reaction to AutoCAD The user-interface of AutoCAD was initially disliked by many industry experts. The fact that a computer could not adequately interpret drawings on its own has long been the perceived barrier of computer-aided drafting (CAD) tools. After a few years of use, many CAD users had their share of frustrations with AutoCAD. The first AutoCAD could not display all the blocks (geometric building blocks) available in an architectural software application, nor could it display the architectural applications of the buildings they were created with. The technology existed to do so, but the time constraints and strictures of the market did not allow for the development of a complete architecture package. AutoCAD was and is still the only true CAD package that offered a complete and integrated solution for architectural drafters. AutoCAD's initial lack of design tools was a topic of discussion and frustration for many users. Other CAD package products were originally released only as packages that came with one, or a few CAD applications; but in time most of these packages released a second, third, or fourth application. Only AutoCAD was the first CAD package released with all the CAD applications from an architecture application to an electrical and/or mechanical design application, all in a single package. AutoCAD was the first comprehensive package, and the technology existed, but the time constraints of the architectural market did not allow for the development of a comprehensive architectural application. The initial version of AutoCAD shipped with only a single cursor. It was not until the release of AutoCAD X, AutoCAD Release 11, AutoCAD 2007, and AutoCAD LT that users would have two or more cursors. The advanced version of AutoCAD introduced the technology to many users to work on the same drawing at the same time. The first version of AutoCAD introduced a feature that required users to reconfigure the menus to load applications to run properly. Unfortunately, the first two or three releases of AutoCAD shipped with this 'non-standard' feature. AutoCAD Release 11 introduced a standard menu that no longer required any user involvement to load

the applications. The features and functionality of AutoCAD continue to grow, and the development of AutoCAD by Autodesk continues to improve. Because of the new features in AutoCAD LT, some users were confused about how to operate the product. It was not until AutoCAD LT Release 11 that the

Chris Heyerdahl, one of the pioneers of the modern era of English shoemaking, died on March 26 at age 70. He made shoes for hundreds of retail stores around the world, including Filson's and The Copley, as well as for the British Royal Family. (His last title was Director of Footwear at The Copley.) A native of Kent, England, he also made shoes for the British Olympic Team, and other high-profile athletes, including skateboarding legend Tony Hawk. Heyerdahl wasn't aware of the project in advance; he woke up in the middle of the night to find a package in the mail. The box contained Chris Hoekstra's training shoe, complete with a note. In the note, Heyerdahl was told that he and his brother had been chosen to make the next batch of custom Filson's for the Kings of Leon, and that he'd be going to see the band at the Hollywood Bowl. "On my way down to Santa Monica, I kept thinking, 'Why would a band, why would a big group of people, why would they pick me?'" Heyerdahl recalled. "It all

seemed like it was a bit of a fantasy. I was a shoe designer, an eccentric shoe designer, in a sense. That is, I don't really fit into the rest ca3bfb1094

Q: How to make HTML Button Close previous window in Chrome and IE I am having a problem in my project with closing the previous window of the window. The example I am using to show my problem:

HTML: Click here to close Open Google JS: `window.onload = function(){ window.close(); }`; The problem is that when you click on my button to close the browser, the previous window of the browser closes and opens the new window. How can I prevent that? A:

Chrome/IE7/IE8: In the markup, give the link a name: Click here to close Then, in the script, add: `window.close(window.opener)`;

Chrome/IE9: On pages that are behind login pages, or to allow scripts to 'run' on pages, you must add a reference to the login page in the page's location: Once logged in, you must have the page send a header back to the opener, to keep the opener alive:

`window.opener.location = ""`; Then you can add the same script that worked for previous versions of IE: `window.onload = function(){ window.close(window.opener); }`; The following provides a solution that I created for use in a production environment. If you need more performance and less memory footprint, you should use this solution.

Overview This solution uses the following: Microsoft Dynamics AX.

FlexConnect System. SQL Server 2012 SQL Server Management

Studio Dynamics AX This solution is a Web Role that runs within a

Web Host (in my case an Azure VM) and serves HTTP requests via IIS.

The project is based upon the basic
