I have been trying to create an object with a parameter that can be used as a subroutine. I am trying to pass as parameter how many times I want to run the subroutine. The best way I could think of doing this is by creating a variable called count and after each iteration, increment it. Something like this: my \$count = 1; sub test { while (1) { print "test ". \$count. " times "; \$count++; } } my \$test = test(4); print "test "; print \$test->(). " "; This gives me error: Can't call subroutine "test" defined at test.pl line 11. If anyone has a better approach I would be very glad to know it. Thanks! A: Calling a subroutine is done by wrapping the subroutine and then using () in front of it. So you have to do the following: sub test { while (1) {
