Prophylactic treatment against Human papillomavirus (HPV) infections is a highly cost-effective intervention and is recommended for all women at high risk of developing cervical intraepithelial neoplasia (CIN) and cervical cancer. The aim of this study was to evaluate the utility of monitoring four high risk HPV types in monitoring the cervical infections in women with long-term follow-up. Samples from women with long-term follow-up (a maximum of 10 years) were obtained by cervical cytology and analyzed for HPV DNA by the Polymerase chain reaction
