Nanoscale magnetic fields can suppress membrane-spanning particles such as bacteria or viruses, and the ability to do so has raised an interest in understanding the effects of such a magnetic field on a biological membrane. We investigated the influence of a weak uniform magnetic field on the planar lipid membrane by a Monte Carlo simulation. We studied how a membrane alters the distribution of the area and the length of the membrane patch when the membrane is bent into a parallel or a perpendicular direction with respect to the magnetic field. The results indicate that the membrane area in a perpendicular direction is lower than that in a parallel direction, and the membrane area of a flat membrane is well fitted 6d1f23a050
