Toxicity of metronidazole to the amphibian, *Xenopus laevis*. The effects of sublethal concentrations of metronidazole on the survival of wild-caught *Xenopus laevis* were examined. Metronidazole had a moderate toxicity to the tadpoles, with a 50% lethal concentration (LC50) of 172 mg/L. This toxicity was more intense on the seventh day of exposure than on the first day. The environmental temperature also influenced the toxicity. The tadpoles were significantly more sensitive to metronidazole at 20 degrees C than at 22 degrees C. The ability of metronidazole to alter the ability of tadpoles to undergo cellular oxidation-reduction reactions was examined. Metronidazole alone or in combination with other chemicals tested did not significantly alter the production of superoxide anion by tadpole erythrocytes or the cytochrome P-450 monooxygenase activity of tadpole liver microsomes. When metronidazole was combined with ferrous sulphate, however, a significantly enhanced production of oxygen radicals was detected. This effect was seen when either the metronidazole alone or the ferrous sulphate alone were combined with the tadpoles but not when the metronidazole or the ferrous sulphate alone were administered to the tadpoles. In conclusion, metronidazole itself did not have a direct toxic effect in this species, but if it was combined with a chemotherapeutic agent, it might enhance the inhibition of cellular respiration. 1. Field of the

Download Best Mufrodat Bahasa Arab Book in pdf format which is available in English Language. This Book is compiled by Farooq Ahmad..Q: What is the difference between const, readonly, auto? Can someone explain in terms of what these mean, and when they should be used? A: They are all

---

types of pointers, but with different attributes: `readonly` - the setter won't be called, so the value won't change after the object gets constructed. `const` - setter can't be called, so noone will be able to change the value after the object gets constructed. `auto` - the value will be declared/defined once the object is created, and the type will become constant once the object is instantiated, so noone will be able to change the value after the object is instantiated. A: `Const` and `readonly` are the most well-known variables. They're easy to understand, but they do have a limitation: for example, `auto foo = a + b; foo is const by default, so this is not legal. auto foo = a + b; foo += c; // this is OK, because the addition operator is const` These are constants. `readonly` is fairly new and hasn't been widely used. For example, it isn't possible to do this: `readonly int x = a + b; x += c; // not allowed, even if the underlying type is const` It does restrict certain things, such as this: `auto f() -> readonly int* ptr = &a; 6d1f23a050`
