solidworks provides the 3d designer and the 3d drafting/design tools. the 3d designer is used to create three-dimensional solid modeling objects. the designer works with solidworks data and adds geometric information to the model using a variety of geometry and surface tools. the 3d drafting/design tools are used to define a 3d model of a part or assembly. the tools are used to create 2d drawings, drawings in 3d space (including 3d exploded views), and drawings on the part's surface. solidworks provides an integrated product lifecycle (ipl) solution that enables you to model a product, simulate its performance, and analyze its manufacturability in a single integrated environment. it enables designers to perform the following: 3d product modeling enables the creation of solid models of a product. solidworks applies the unified modelling language (uml) to create the 3d product model. you can use solidworks data and add geometric information to the model using a variety of geometry and surface tools. the solidworks and solidworks teams have jointly developed a uml-based model called the unified modeling language (uml) which has been adopted by the solid modeling industry. 3d product analyze enables the creation of a solid model for the purpose of material analysis. you can use the solidworks and solidworks tools to create a solid model and perform material analysis on a product. you can analyze the material and other physical properties of a product's components. solidworks provides a unified modeling language (uml) that is used to provide a framework for the design, development, and documentation of integrated product systems. a product specification and definition can be created and stored in a repository.
