one thing really i cant stand about work space is the option to delete it when you go to start it. it can be a real pain to have to recreate it all every time. i still prefer amazon.com style where you can open it from browser. but if it wouldnt exist id really like that option back. a: environments can have multiple application types including windows or linux virtual machines, docker containers, and amazon machine images (ami). they can use public or private ip addresses. for each application type, you can designate a default vpc and/or subnet, and specify the security group to use when that application type is launched. you can change the rules associated with an application type at any time, even after it has launched. a: after you create your vpc, add a new security group (eg: marvell-bg) and reference it in the vpc description by the name mentioned above, eg: you can then update your ec2 and vpc settings in one step from the workspaces console by going to "software", "maintenance settings", "software installed", and then selecting the latest version of windows 10. if you do not install windows 10 at this time, the old version will be installed. a: the amazon virtual private cloud (vpc) is a collection of networks and resources that create a virtual container. you can create networks for general networking, or you can use them to create virtual datacenters and networks for your instances. your instances can be in any availability zone in the region in which your vpc is located. the availability zone is the geographical location in which your vpc is physically located.
