Bronchial asthma is a chronic inflammatory disorder of airways and is considered to be an allergic condition. Certain groups of patients present with persistent airflow obstruction. Certain drugs may aggravate airway obstruction in these patients. Chronic obstructive pulmonary disease (COPD) is a chronic inflammatory disease of airways and emphysema, resulting in obstruction of airflow as a consequence of destruction of lung parenchyma. In contrast to asthma, no serum IgE is required for its development, but the disease is usually associated with inflammation and increased mucous production. Its cause is unknown but smoking is the main culprit. Introduction {#sec1-1} ===== Bronchial asthma, COPD, and emphysema are chronic inflammatory diseases of the airways. Tobacco smoking is an established risk factor for these diseases. This article highlights the common pathophysiological mechanisms involved in these diseases and demonstrates their etiological and pathogenetic links. Bronchial asthma is a chronic inflammatory disorder of airways and is considered to be an allergic condition. Asthma is commonly described as an allergic disease involving multifactorial causes.[[ref1]] A large number of other causes of intermittent wheeze, ranging from nonallergic inflammation and eosinophilic airway inflammation to infections, to bronchiectasis have been reported.[[ref2]][[ref3]] There are several clinical phenotypes of bronchial asthma, such as atopic, nonatopic, age-related, and occupational asthma. Atopic asthma is the most common form.[[ref4]] Certain groups of patients present with persistent airflow obstruction even after the usual treatment.
