Class 1 Laryngoscopes: a new device for supraglottic airway training. The concept of an emergency cricothyroidotomy is not a new one, but its use for field treatment of the acutely unresponsive airway has not been well described in the literature. Cricothyroidotomy is most commonly practiced by emergency physicians in the prehospital setting, but in the future, the authors believe that use of the supraglottic airway will be expanded to general emergency physicians and Emergency Medical Technicians (EMTs) to avoid expensive airway systems and equipment. The authors describe a technique for performing a cricothyroidotomy in an emergency setting in order to simulate clinical practice with a new supraglottic airway device. A 41-year-old male with a history of asthma was found unresponsive in his home. After normal findings of the airway on examination, resuscitative maneuvers were initiated, but the patient was still unresponsive. A cricothyroidotomy was performed using a supraglottic airway device (Cook Medical Inc, Bloomington, IN). This technique was then used in a model simulating a previously unresponsive airway. The cricothyroidotomy was completed without difficulty. The patient recovered from the cricothyroidotomy. The technique for this procedure is presented. It can be performed by paramedic or physician EMTs as well as emergency physicians. It allows them to practice emergency airway placement in a simulated setting.

Q: Resolving issues with the includes and not being able to switch between classes I am new to Arduino and I am running into some issues with my project. It's supposed to be an Arduino based project where different "classes" are used as switches and once a class is pressed a switch name is sent to a microcontroller and the desired outcome is determined by the microcontroller. I thought of making a sub project in Arduino where I can
