What's New In?

Electronics Assistant is an electronic calculator for estimating resistor values, capacitors, inductors or other components for an electronic project. The program provides a useful and easy way to solve complex engineering calculations, through a toolset that enables you to choose a calculation method and to calculate, edit, copy and

convert values between one calculator to another. You can easily combine calculations to estimate the cost and build time of your project. The program also provides a library with a set of general rules and equations (known as the Electronic Laws), and you can use it to estimate resistor values, current and voltage, impedance, impedance matching, amplification, frequency and many other types of calculations. Other Functions: The application is very easy to use, with a graphical interface, and includes a list of all the calculators, divided into categories according to their

use (Resistance, Capacitance, Inductance or Frequency) and a tool selection window that shows the results and the interface for selecting the required calculator. You can then enter your parameters or constants, select a calculator for the required calculation method (For example, to calculate the resistance of an unknown resistor) and select the calculator for the conversion you need (For example, from milli ohms to mega ohms). When you select a calculator, you are asked to specify the range and units, if you need to convert the results, and the application

calculates the result and displays it in the tool selection window. If you want to enter other calculators, the interface allows you to select the appropriate parameters. The program allows you to copy data between calculators and export the results to text files if you need to use them later. All the parameters and constants are shown on the tool selection window. You can also copy parameters or constants from a calculator to another. You can select the desired calculator, type the values in the calculator, and then type the data required for the other calculator. A data conversion utility is

available and you can copy values from a tool to another. You can use it to change the value range or apply different units. Electronics Assistant includes a library with a set of general rules and equations (known as the Electronic Laws), and the program uses these rules to solve some of the equations that you might have encountered. For example, you can easily solve the calculation of the impedance of a circuit or an inductor or capacitor without using the calculator and you can choose from among all the possible methods to calculate a specific parameter. Using this application will

allow you to solve many engineering calculations easily and quickly. Contacts For Technical Support, please email us at support@staco.com. For Customer Service, please email us at support@staco.com. Note: Certain terms in this License Agreement are defined in the Glossary at Terms of Use License
