Another new feature that might be important to mention is the option to turn the app into a desktop project. This means that you no longer need to worry about file sizes when uploading to the cloud. Not on the iPad or iPhone that's for sure (the cloud connectivity limitations of the device are a fact), but you can always resize images online. Of course, if the photos are originals, then you are correct that there is no possibility of being able to do that on the device. For the time being, I would assume that you need to be very careful to maintain the correct resolution of your images. You cannot zoom and you cannot enlarge. Nothing that the touchscreen of your iPad should not be able to handle. However, you can copy and paste - or better yet, drag and drop. The desktop mode also means that you can fully outlive your library of files. Any changes that you make to an original image will affect that same photo when it is viewed later on, even if it is on a different platform. Re-sizing and cropping in the desktop offer a slaver even as they allow you to outlive your originals. As the Android version of Photoshop comes with a lot of features that are missing from the iPhone version, it is a bit strange to find a lot of details in one version but missing in the other. This late stage of the project is not as polished and polished as it should be. When I said "details", I meant the things about the

app's interface that make it feel and feel smoother. The feel of the "right" brush for the tool of choice, for example. Text tools include the ability to create slightly thicker lines, but these lines do not have a beveled look. All rulers are sanded down so as to not look as as if you were editing on a sandpaper sample, no matter what scale you are working on. Overall, the feels are the same, just that some things are absent on the iPhone version. Examples include the ability to drag a line when sketching and the ability to zoom in and out.

With **Ponzi scheme** being just an illusive game where someone steals from the old to give to the new, **virtual currencies** represent the ideal approach to controlling the thieves. The computer programs that make the cool effects you see on television and maybe even on your smartphone and tablet are called image editors. There are lots of them out there, and they all do the same thing—they modify the pixels in your picture or video. Photoshop lets you manipulate your pictures on the monitor screen in real time, but the effects take a few seconds to work. So whenever your picture isn't changing in real time, Photoshop is not changing it in real time either. In the meantime, your other applications, which you might be using while Photoshop does its thing, will still be working on the picture. If something goes wrong, Photoshop won't notice. So it's good to keep Photoshop as the last step in your workflow. You might consider keeping it in a separate partition to make sure nothing goes horribly wrong during the editing process. You can't waste time watching the clock run out as you try to achieve a final look. So you've better decide ahead of time how long you need to take to fix your image. (The more unique and complicated your image, the longer you'll need.) Pick the software with the greatest potential for the task and the best tools when you need them most. (For instance, you might determine in advance that you've got a good hour to spend on an image because you know you can clean it up quickly, but you've got only five minutes to perfect an image because you're sure it'll need more involved tweaking to look its best.) e3d0a04c9c
